

MongoDB Connection URI:

mongodb+srv://User2:JOI9MmVa4fmUC2XS@cluster0.xq4xd.mongodb.net/?retryWrites=true&w=majority&appName=Cluster0

App Status:

Working

The application is running smoothly, connects to MongoDB Atlas without any issues, and all features — including user login, RSVP handling, and event management — are functioning as expected.

What was easy:

Once the basic structure was set up, building the core event routes and rendering views with EJS felt pretty straightforward. Setting up user authentication and working with partials in the layout also came together quite easily with Express.

What was hard:

The RSVP logic took the most effort. Making sure a user could only RSVP once, and having that update correctly (without creating duplicates) was tricky. Dealing with edge cases like RSVP entries tied to deleted events caused a few unexpected bugs. Also, getting image uploads to save with the right path and display correctly on the event detail page needed some trial and error. But once everything clicked, it was worth the effort.
